ABSTRACT OF THE DISCLOSURE

In a color conversion method of inputting at
least two color difference values and obtaining a

5 corresponding saturation value, a main lookup table
which stores the saturation value for the color
difference values, and a sub-lookup table for obtaining
an address for accessing the main lookup table are
created. The address of the main lookup table is

10 determined on the basis of the sub-lookup table and the
difference between the two color difference values, in
correspondence with two arbitrary color difference
values. A saturation value corresponding to the two
color difference values is obtained from the determined

15 address of the main lookup table.
